

mm.PIP

PIP Arthrodesis implant

Bioabsorption. Stability of metal.

The **mm.PIP** implant is an absorbable implant for the surgical treatment of hammer or claw toe corrections. Due to its metallic strength, barbed design and the intramedullary position, it has a secure, both axially and rotationally high biomechanical stability.

The **mm.PIP** is available in two sizes and different length and angulations. This ensures correct sizing for all anatomical intramedullary channel shapes and widths.

Intended purpose

mm.PIP is a bioabsorbable intramedullary implant used for bone reconstruction via proximal interphalangeal joint arthrodesis of the lesser toes during therapeutic surgery on adult patients. The mm.PIP is available in various anatomical widths, angles, and lengths, see next page.

SIZE M

Length	Angle	Article number
20	0	015.0200
	10	015.0201
	20	015.0202
21	0	015.0210
	10	015.0211
	20	015.0212
22	0	015.0220
	10	015.0221
	20	015.0222

Core Diameter: 1.7 mm | Width: 3.8 mm

SIZE L

Length	Angle	Article number
20	0	015.1200
	10	015.1201
	20	015.1202
21	0	015.1210
	10	015.1211
